

Eato — Your calories under control

Scan · track · plan your nutrition with AI

Eato

Your calories under control.

Project Context

Eato is an AI-powered calorie and nutrition tracker that makes eating well effortless — snap a photo, scan a barcode, or describe a meal and get instant calories, macros and smart suggestions. Most people who try to track what they eat quit within weeks, because manual logging is slow and tedious. Eato was designed to remove that friction entirely: the camera does the work, the breakdown is instant, and an AI coach nudges you toward your goals. The design challenge was to make nutrition feel motivating and clear, not clinical — so people actually stick with it. Every screen turns a number into a next step.

Individual Project

TIMELINE
8 Weeks · 2026

Problem

People genuinely want to eat better — but the moment they try to track it, the friction kills the habit. Manual logging means searching databases, guessing portions and decoding confusing labels for every single meal. It's slow, tedious and easy to get wrong, so most people give up within a couple of weeks and never get the insight they were after. **The opportunity: make tracking so fast and clear that staying consistent stops feeling like work — and healthy eating finally sticks.**

73%

of people abandon a food-tracking app within the first 30 days.

5+ min

to log a single meal manually — searching, weighing and guessing.

2 in 3

people can't accurately estimate the calories on their own plate.

Indicative figures. Sources: consumer health-app retention studies · nutrition-estimation research. Replace with your study's data.

Approach

I started from the single reason people quit — friction — and designed the whole experience to erase it. The methodology: let the camera and AI do the heavy lifting, make every result instantly legible, and always leave the user with a clear next action rather than a wall of numbers.

1

Kill the logging friction

Snap a photo or scan a barcode instead of typing — the AI recognises the meal and fills in the data in seconds.

Key decision: scan first, search later.

2

Make nutrition legible

A calorie ring and macro breakdown turn raw data into something you grasp at a glance — and can decode bite by bite.

Key decision: show the breakdown, not just a number.

3

Turn data into a next step

Caly AI flags what's missing and can build a meal to fit your goals, so every screen ends in an action.

Key decision: always answer "so what should I eat?"

What was the problem I was trying to solve?

How might we make calorie and nutrition tracking so fast and clear that people actually stick with it — without manual logging or guesswork?

Final Solution

Snap it, understand it, act on it — the whole loop in seconds, with AI doing the tedious parts.

Home & daily goal

One glance shows the whole day — a **calorie ring**, macro split and today's log, with "585 kcal left" front and centre so the next decision is obvious.

The day's food sits right beneath the ring, and a single tap on the orange button starts a scan — keeping the core loop one thumb away.

Calorie ring

Macro split

One-tap scan

Scan & decode

Point the camera or scan a barcode and Eato **recognises the food instantly**, breaking it into calories and macros in seconds — no searching, no guessing.

Caly AI reads it in context and flags what's missing — "you're low on protein today" — turning a label into useful advice.

AI recognition Instant macros Smart suggestions

Build meals with Caly AI

Tell the AI a goal — "30g protein under 300 kcal" — and it builds a balanced meal ingredient by ingredient, matched to what's left in your day.

Add it to your plan in one tap, so the app doesn't just measure your eating — it actively helps you hit your targets.

One-tap plan

Results

By removing the friction, tracking became something people kept doing — and the numbers followed.

<3 sec

to log a meal by photo — versus 5+ minutes manually

200k+

downloads on the App Store

10M+

verified foods in the database

4.8★

average App Store rating

Representative figures — replace with your project's verified metrics.

I've quit every calorie app I've ever tried. Eato is the first one that stuck — snapping a photo is so fast it doesn't feel like tracking, and the AI nudges actually keep me honest.

Tools & Timeline

Eight weeks from first sketch to a polished, shippable app — designed and built end-to-end.

Week 1

Discovery

User research, habit & retention study, success metrics.

Weeks 2–3

Design

Flows, brand, UI system and high-fidelity screens in Figma.

Weeks 4–7

Build

iOS build, camera & on-device AI, iterative testing.

Week 8

Launch

Polish, landing page and App Store release.

Tools & technologies

Figma SwiftUI Core ML Vision AI Nutrition API
Framer

Scope

Product strategy · UX flows & habit design
Brand & UI system · iconography, motion
iOS build · camera scan & on-device AI

Outcome & Reflection

A nutrition tracker people actually keep using — because the hardest part, logging, all but disappears. Eato turns a daily chore into a few seconds of camera-and-AI, and a number into a clear next step.

WHAT I'D EXPLORE NEXT

Barcode-to-recipe suggestions, wearable & Apple Health sync, and streaks with gentle social accountability — so motivation comes from progress, not willpower.
